Cost figures as of: December 2016

Bayou Dupont Ridge Creation and Marsh Restoration (BA-48)

Project Status

Approved Date: 2007
Project Area: 309 acres
Approved Funds: $38.2 M
Total Est. Cost: $38.9 M
Net Benefit After 20 Years: 186 acres
Status: Construction
Project Type: Marsh Creation
PPL #: 17

Location

This project is located within the Barataria Basin in Jefferson and Plaquemines Parishes. The marsh creation area is located along Bayou Dupont southeast of the enclosure known as the Pen.

Problems

There is widespread historic and continued rapid land loss within the project site and surrounding areas resulting from subsidence, wind erosion, storms, and altered hydrology. Land loss data provided by the U.S. Geological Survey indicates that loss was occurring at a rate of 1.7% per year prior to construction. The natural limits of Bayou Dupont were difficult to determine in some areas because land loss was causing the coalescence of the bayou with adjacent water bodies. Natural tidal flow and drainage patterns that once existed through the bayou were circumvented by the increasing area of open water.

Vegetation covers much of the marsh creation features on BA-48. The Long Distance Sediment Pipeline Corridor stretches past the project in the background.

Restoration Strategy

Project goals include 1) creating and nourishing approximately 330 acres of marsh through pipeline sediment delivery from the Mississippi River, and 2) creating a 2 mile long ridge along a portion of the southwestern shoreline of Bayou Dupont. Sediment from the river will be hydraulically pumped to the project site to construct both the marsh and ridge features. The ridge is designed to mimic the configuration of other natural ridges within the watershed, which will include a constructed elevation conducive for the growth of native vegetation such as live oak, hackberry, and yaupon. The ridge will help redefine the limits of Bayou Dupont and reestablish the natural bank that once flanked the bayou and protected adjacent marshes.

Progress to Date

Construction began in Fall of 2014 in conjunction with the Mississippi River Long Distance Sediment Pipeline Project BA-43EB. Construction was completed in Fall of 2015.

This project is on Priority Project List 17.
